

Phishing Email Analysis Report

Student Name: A Haleema

Date: 01-06-2026

Figure 1: Sample Phishing email used for analysis.

Analysis:

Sender Analysis

- The sender email address is `services@paypal-accounts.com`.
- This does not appear to be an official PayPal domain.

- This suggests possible email spoofing.

Urgent Language

- The email states that the account will be disabled within 24 hours.
- This creates pressure and fear to make the recipient act quickly.

Generic Greeting

- The email uses "Dear PayPal customer".
- Legitimate organizations usually address customers by name.

Request for Sensitive Information

- The email asks the user to confirm account details.
- This is a common phishing tactic used to steal credentials.

Suspicious Link

- The "Confirm Your Information" button may redirect users to a malicious website.
- The actual destination URL is hidden.

Grammar and Writing Issues

- The email contains awkward wording and punctuation.
- Professional organizations generally use better-quality communication.

Header Analysis

- Email headers were not available because the sample was obtained as a screenshot.
- Therefore, sender authentication could not be verified.

Conclusion

The email displays multiple phishing characteristics, including a suspicious sender address, urgent language, a generic greeting, a request for sensitive information, and a potentially malicious link. Based on these indicators, the email is highly likely to be a phishing attempt.
